

I have a 64bit PC. How do I install Recruit Studio?

The only real difference with users of 64bit PCs is that you need to use the static Recruit Studio client (i.e. you cannot use the auto-update version of the client). You also need to use the 32bit version of Office. Other than that, everything else is the same.

The question is, how much software do you need to install on your 64bit PC?

If you are a single user or if you want to run the data service from this PC then you need to [follow these instructions](#).

If you only need to install the client software onto this PC you can do the following:

1. Go to www.recruitstudio.co.uk and from the Download menu choose 'Download Recruit Studio'.
2. If your PC is 64bit it is likely to have the Microsoft .NET framework already installed (step 1 on the Download page). This means that you can skip this and click step 2 to download 'Recruit Studio client'. Click 'Run' when prompted and allow the software to download and install.
3. Configure Recruit Studio to find your Recruit Studio data. You can find out how to do that [here](#).

If you're not sure how much to install, it would be a good idea to read '[Understanding how Recruit Studio works](#)' before you go any further.
